

Medical Report

Patient Information

Patient Name: John Doe

Date of Birth: January 15, 2010

Patient ID: 123456

Consulting Physician: Dr. Jane Smith

Hospital: City General Hospital

Date of Examination: October 10, 2023

Symptoms

During the consultation, the patient presented with the following symptoms:

- Severe fatigue and weakness
- Pallor
- Frequent headaches
- Delayed growth and development
- Shortness of breath during mild exertion
- Jaundice (yellowing of the skin and eyes)

Diagnosis

Following a comprehensive evaluation, including blood tests and family history assessment, the patient was diagnosed with:

- Thalassemia Major**

This is a severe form of thalassemia characterized by a significant reduction in hemoglobin production, leading to chronic anemia and associated complications.

Treatment Plan

The treatment plan for Thalassemia Major includes:

- Regular blood transfusions to manage anemia

- Iron chelation therapy to prevent iron overload due to repeated transfusions
- Folic acid supplementation to aid in red blood cell production
- Monitoring for complications such as splenomegaly and potential organ damage
- Genetic counseling for the family

Prescription

The following medications were prescribed for the patient:

- Ferrous sulfate 325 mg orally once daily
- Deferasirox (Exjade) 500 mg orally once daily for iron chelation
- Folic Acid 1 mg orally once daily

Follow-Up

The patient is advised to return for follow-up consultations every month to monitor:

- Hemoglobin levels
- Iron levels and overall health status
- Growth and development

In case of any acute symptoms or complications, immediate medical attention is recommended.

Conclusion

Thalassemia Major requires continuous management and support. The patient and family have been educated about the condition and the importance of adherence to the treatment plan.
